

P-20D

Compact Pressure Transmitter With I²C Digital Output

- Pressure range : 0 to 600mmH₂O
- Piezo-resistive silicon micro-machined sensor
- Gauge type pressure sensor
- I²C interface
- Temperature Compensation : 0 ~ 50°C
- Operating voltage 5.0V
- RoHS compliant and Halogen-free

The P-20D is the pressure sensor which measures gauge pressures. It consists of a silicon micro-machined sensing element chip and a signal conditioning ASIC. The pressure sensor element and the ASIC are mounted inside a system-in-package and wire-bonded to appropriate contacts. The P-20D provides the digital output data with the format of I²C interface. It can achieve ESD robustness, fast response time, high accuracy and linearity as well as long-term stability. All measurement data is fully calibrated and temperature compensated. In addition, it allows for easy system integration. Pressure transmitter has a variable semiconductor sensing element with a programmable ASIC and a hybrid circuit for reliable signal conditioning and maximum electronic integration.

Each sensor is referenced on the bus by a 7 bit slave address. The slave address is 1001100. The eighth bit of control address is read or written which assigned by processor.

□ Bus protocol

chart

- ❖ Data transfer may be initiated only when the bus is not busy.
- ❖ During data transfer, the data line must keep stable whenever the clock is HIGH level. Changes in the data line while the clock line is HIGH will be interpreted as a start or stop condition.
- ❖ Following bus conditions has been defined as Figure 2.

□ The data bus timing

chart

When the bus is free, both lines are pulled up to +ADD. Data on the I²C-bus can be transferred at a rate up to 100 kbit/s in the standard-mode, or up to 400 kbit/s in the fast-mode.
